

### Continuous Random

### Variables and

### Probability

### Distributions

#### **CHAPTER OUTLINE**

- 4-1 CONTINUOUS RANDOM VARIABLES
- 4-2 PROBABILITY DISTRIBUTIONS AND PROBABILITY DENSITY FUNCTIONS
- 4-3 CUMULATIVE DISTRIBUTION FUNCTIONS
- 4-4 MEAN AND VARIANCE OF A CONTINUOUS RANDOM VARIABLE
- 4-5 CONTINUOUS UNIFORM DISTRIBUTION

- 4-6 NORMAL DISTRIBUTION
- 4-7 NORMAL APPROXIMATION TO THE BINOMIAL AND POISSON DISTRIBUTIONS
- 4-8 EXPONENTIAL DISTRIBUTION

#### LEARNING OBJECTIVES

After careful study of this chapter you should be able to do the following:

- Determine probabilities from probability density functions.
- Determine probabilities from cumulative distribution functions and cumulative distribution functions from probability density functions, and the reverse.
- Calculate means and variances for continuous random variables.
- 4. Understand the assumptions for each of the continuous probability distributions presented.
- Select an appropriate continuous probability distribution to calculate probabilities in specific applications.
- Calculate probabilities, determine means and variances for each of the continuous probability distributions presented.
- Standardize normal random variables.
- 8. Use the table for the cumulative distribution function of a standard normal distribution to calculate probabilities.
- Approximate probabilities for some binomial and Poisson distributions.

### 4-1 Continuous Random Variables

Previously, we discussed the measurement of the current in a thin copper wire. We noted that the results might differ slightly in day-to-day replications because of small variations in variables that are not controlled in our experiment—changes in ambient temperatures, small impurities in the chemical composition of the wire, current source drifts, and so forth.

Another example is the selection of one part from a day's production and very accurately measuring a dimensional length. In practice, there can be small variations in the actual measured lengths due to many causes, such as vibrations, temperature fluctuations, operator differences, calibrations, cutting tool wear, bearing wear, and raw material changes. Even the measurement procedure can produce variations in the final results.

Figure 4-2 Probability determined from the area under f(x).

#### **Definition**

For a continuous random variable X, a probability density function is a function such that

$$(1) \quad f(x) \ge 0$$

(1) 
$$f(x) \ge 0$$
  
(2) 
$$\int_{-\infty}^{\infty} f(x) dx = 1$$

(3) 
$$P(a \le X \le b) = \int_{a}^{b} f(x) dx = \text{area under } f(x) \text{ from } a \text{ to } b$$
  
for any  $a$  and  $b$  (4-1)

Figure 4-3 Histogram approximates a probability density function.

If X is a continuous random variable, for any  $x_1$  and  $x_2$ ,

$$P(x_1 \le X \le x_2) = P(x_1 < X \le x_2) = P(x_1 \le X < x_2) = P(x_1 < X < x_2) \quad (4-2)$$

### Example 4.1

- Let the continuous random variable X denote the current measured in a thin copper wire in milliamperes. Assume that the range of X is [0,20 mA], and assume that the probability density function of X is f(x) = 0.05 for  $0 \le x \le 20$ .
- What is the probability that a current measurement is less than 10 milliamperes?
- And the probability that a current measurement is more than 5 and less than 20?

### Example 4-2

Let the continuous random variable X denote the diameter of a hole drilled in a sheet metal component. The target diameter is 12.5 millimeters. Most random disturbances to the process result in larger diameters. Historical data show that the distribution of X can be modeled by a probability density function  $f(x) = 20e^{-20(x-12.5)}$ ,  $x \ge 12.5$ .

If a part with a diameter larger than 12.60 millimeters is scrapped, what proportion of parts is scrapped? The density function and the requested probability are shown in Fig. 4-5. A part is scrapped if X > 12.60. Now,

#### Solution:

$$P(X > 12.60) = \int_{12.6}^{\infty} f(x) dx = \int_{12.6}^{\infty} 20e^{-20(x - 12.5)} dx = -e^{-20(x - 12.5)} \Big|_{12.6}^{\infty} = 0.135$$

Figure 4-5 Probability density function for Example 4-2.

Example 4-2 (continued)

What proportion of parts is between 12.5 and 12.6 millimeters? Now,

#### Solution:

$$P(12.5 < X < 12.6) = \int_{12.5}^{12.6} f(x) dx = -e^{-20(x-12.5)} \Big|_{12.5}^{12.6} = 0.865$$

Because the total area under f(x) equals 1, we can also calculate P(12.5 < X < 12.6) = 1 - P(X > 12.6) = 1 - 0.135 = 0.865.

### 4-3 Cumulative Distribution **Functions**

#### **Definition**

The cumulative distribution function of a continuous random variable X is

$$F(x) = P(X \le x) = \int_{-\infty}^{x} f(u) du$$
 (4-3)

for  $-\infty < x < \infty$ .

### 4-3 Cumulative Distribution **Functions**

#### Example 4.3

For the copper current measurement in Ex 4.1, the cumulative distribution function of the random variable X consists of three expressions. If x<0, f(x) = 0. Therefore,

$$F(x) = \begin{cases} 0 & , & x < 0 \\ 0.05x & , & 0 \le x < 20 \\ 1 & , & 20 \le x \end{cases}$$

### 4-3 Cumulative Distribution **Functions**

### Example 4-4

For the drilling operation in Example 4-2, F(x) consists of two expressions.

$$F(x) = 0$$
 for  $x < 12.5$ 

and for  $12.5 \le x$ 

$$F(x) = \int_{12.5}^{x} 20e^{-20(u-12.5)} du$$
$$= 1 - e^{-20(x-12.5)}$$

Therefore,

$$F(x) = \begin{cases} 0 & x < 12.5 \\ 1 - e^{-20(x - 12.5)} & 12.5 \le x \end{cases}$$

Figure 4-7 displays a graph of F(x).

## 4-3 Cumulative Distribution Functions

Figure 4-7 Cumulative distribution function for Example 4-4.

# 4-3 Cumulative Distribution Functions

### Example 4.5

The time until a chemical reaction (in milliseconds) is approximated by the cumulative distribute function:

$$F(x) = \begin{cases} 0 & , x < 0 \\ 1 - e^{-0.01x} & , 0 \le x \end{cases}$$

Find the probability density function of X. What proportion of reactions is complete within 200 milliseconds.

#### Solution:

Using the result that the probability density function is the derivative of F(x), we obtain

$$f(x) = \begin{cases} 0 & x < 0 \\ 0.01 e^{-0.01x} & 0 \le x \end{cases}$$

The probability that a reaction completes within 200 milliseconds is

$$P(X < 200) = F(200) = 1 - e^{-2} = 0.8647$$

## 4-4 Mean and Variance of a Continuous Random Variable

#### **Definition**

Suppose X is a continuous random variable with probability density function f(x). The mean or expected value of X, denoted as  $\mu$  or E(X), is

$$\mu = E(X) = \int_{-\infty}^{\infty} x f(x) dx \tag{4-4}$$

The variance of X, denoted as V(X) or  $\sigma^2$ , is

$$\sigma^{2} = V(X) = \int_{-\infty}^{\infty} (x - \mu)^{2} f(x) dx = \int_{-\infty}^{\infty} x^{2} f(x) dx - \mu^{2}$$

The standard deviation of X is  $\sigma = \sqrt{\sigma^2}$ .

## 4-4 Mean and Variance of a Continuous Random Variable

### Example 4-6

For the copper current measurement in Example 4-1, the mean of X is

$$E(X) = \int_{0}^{20} xf(x) dx = 0.05x^{2}/2 \Big|_{0}^{20} = 10$$

The variance of X is

$$V(X) = \int_{0}^{20} (x - 10)^{2} f(x) dx = 0.05(x - 10)^{3}/3 \Big|_{0}^{20} = 33.33$$

## 4-4 Mean and Variance of a Continuous Random Variable

#### Example 4-8

For the drilling operation in Example 4-2, the mean of X is

$$E(X) = \int_{12.5}^{\infty} x f(x) dx = \int_{12.5}^{\infty} x \ 20e^{-20(x-12.5)} dx$$

Integration by parts can be used to show that

$$E(X) = -xe^{-20(x-12.5)} - \frac{e^{-20(x-12.5)}}{20} \Big|_{12.5}^{\infty} = 12.5 + 0.05 = 12.55$$

The variance of X is

$$V(X) = \int_{12.5}^{\infty} (x - 12.55)^2 f(x) \, dx$$

Although more difficult, integration by parts can be used two times to show that V(X) = 0.0025.

### Continuous Random

### Variables and

### Probability

### Distributions

#### CHAPTER OUTLINE

- 4-1 CONTINUOUS RANDOM VARIABLES
- 4-2 PROBABILITY DISTRIBUTIONS AND PROBABILITY DENSITY FUNCTIONS
- 4-3 CUMULATIVE DISTRIBUTION FUNCTIONS
- 4-4 MEAN AND VARIANCE OF A CONTINUOUS RANDOM VARIABLE
- 4-5 CONTINUOUS UNIFORM DISTRIBUTION

- 4-6 NORMAL DISTRIBUTION
- 4-7 NORMAL APPROXIMATION TO THE BINOMIAL AND POISSON DISTRIBUTIONS
- 4-8 EXPONENTIAL DISTRIBUTION

#### **Definition**

A continuous random variable X with probability density function

$$f(x) = 1/(b-a), \quad a \le x \le b$$
 (4-6)

is a continuous uniform random variable.

Figure 4-8 Continuous uniform probability density function.

#### **Mean and Variance**

If X is a continuous uniform random variable over  $a \le x \le b$ ,

$$\mu = E(X) = \frac{(a+b)}{2}$$
 and  $\sigma^2 = V(X) = \frac{(b-a)^2}{12}$  (4-7)

### Example 4-9

Let the continuous random variable X denote the current measured in a thin copper wire in milliamperes. Assume that the range of X is [0, 20 mA], and assume that the probability density function of X is f(x) = 0.05,  $0 \le x \le 20$ .

What is the probability that a measurement of current is between 5 and 10 milliamperes? The requested probability is shown as the shaded area in Fig. 4-9.

$$P(5 < X < 10) = \int_{5}^{10} f(x) dx$$
$$= 5(0.05) = 0.25$$

The mean and variance formulas can be applied with a = 0 and b = 20. Therefore,

$$E(X) = 10 \text{ mA}$$
 and  $V(X) = 20^2/12 = 33.33 \text{ mA}^2$ 

Consequently, the standard deviation of X is 5.77 mA.

#### Solution:

The mean and variance formulas can be applied with a = 0 and b = 20. Therefore,

$$E(X) = 10 \text{ mA}$$
 and  $V(X) = 20^2/12 = 33.33 \text{ mA}^2$ 

Consequently, the standard deviation of X is 5.77 mA.

Figure 4-9 Probability for Example 4-9.

The cumulative distribution function of a continuous uniform random variable is obtained by integration. If a < x < b,

$$F(x) = \int_{a}^{x} 1/(b-a) du = x/(b-a) - a/(b-a)$$

Therefore, the complete description of the cumulative distribution function of a continuous uniform random variable is

$$F(x) = \begin{cases} 0 & x < a \\ (x - a)/(b - a) & a \le x < b \\ 1 & b \le x \end{cases}$$

#### **Definition**

A random variable X with probability density function

$$f(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{\frac{-(x-\mu)^2}{2\sigma^2}} - \infty < x < \infty \tag{4-8}$$

is a normal random variable with parameters  $\mu$ , where  $-\infty < \mu < \infty$ , and  $\sigma > 0$ . Also,

$$E(X) = \mu \quad \text{and} \quad V(X) = \sigma^2 \tag{4-9}$$

and the notation  $N(\mu, \sigma^2)$  is used to denote the distribution. The mean and variance of X are shown to equal  $\mu$  and  $\sigma^2$ , respectively, at the end of this Section 5-6.

**Figure 4-10** Normal probability density functions for selected values of the parameters  $\mu$  and  $\sigma^2$ .

#### Example 4 – 10

Assume that the current measurement is a strip of wire follow a normal distribution with a mean of 10 milliamperes and a variance of 4 (milliamperes)<sup>2</sup>. What is the probability that a measurement exceeds 13 milliamperes?

Let X be the current in milliamperes. The requested probability can be represented as P(X>13). This probability is shown as the shaded area under the normal probability density function in Fig. 4 – 11.

Figure 4-11 Probability that X > 13 for a normal random variable with  $\mu = 10$  and  $\sigma^2 = 4$ .

Some useful results concerning the normal distribution

For any normal random variable,

$$P(\mu - \sigma < X < \mu + \sigma) = 0.6827$$
  
 $P(\mu - 2\sigma < X < \mu + 2\sigma) = 0.9545$   
 $P(\mu - 3\sigma < X < \mu + 3\sigma) = 0.9973$ 

Figure 4-12 Probabilities associated with a normal distribution.

#### **Definition: Standard Normal**

A normal random variable with

$$\mu = 0$$
 and  $\sigma^2 = 1$ 

is called a standard normal random variable and is denoted as Z.

The cumulative distribution function of a standard normal random variable is denoted as

$$\Phi(z) = P(Z \le z)$$

### Example 4-11

Assume Z is a standard normal random variable. Appendix Table II provides probabilities of the form  $P(Z \le z)$ . The use of Table II to find  $P(Z \le 1.5)$  is illustrated in Fig. 4-13. Read down the z column to the row that equals 1.5. The probability is read from the adjacent column, labeled 0.00, to be 0.93319.

The column headings refer to the hundredth's digit of the value of z in  $P(Z \le z)$ . For example,  $P(Z \le 1.53)$  is found by reading down the z column to the row 1.5 and then selecting the probability from the column labeled 0.03 to be 0.93699.

Figure 4-13 Standard normal probability density function.

#### Example 4 – 12

The following calculations are shown pictorially in Fig. 4 - 14. In practice, a probability is often rounded to one or two significant digits.

(1) 
$$P(Z > 1.26) = 1 - P(Z \le 1.26) = 1 - 0.89616$$

(2) 
$$P(Z < -0.86) = 0.19490$$

#### Example 4 – 12

(3) 
$$P(Z > -1.37) = P(Z < 1.37) = 0.91465$$

$$(4) P(-1.25 < Z < 0.37) = P(Z < 0.37) - P(Z < -1.25) = 0.53866$$

$$(5) P(Z < -4) \approx 0$$

#### Example 4 – 12

(6) Find the value z such that P(Z>z)=0.05. This probability expression can be written as  $P(Z \le z)=0.95$ . We search the probabilities to find the value that corresponds to 0.95. We do not find 0.95 exactly, the nearest value is 0.9503, corresponding z=1.65.

#### Example 4 – 12

(7) Find the value z such that P(-z < Z < z) = 0.99. Beacause of the symmetry of the normal distribution, if the area of the shaded region in Fig. 4-14 (7) is to equal 0.99, the area in each tail of the distribution must equal 0.005. So, the value for z corresponds to a probability of 0.995 in Table III. The nearest probability is 0.99506, then z=2.58.

### **Standardizing**

If X is a normal random variable with  $E(X) = \mu$  and  $V(X) = \sigma^2$ , the random variable

$$Z = \frac{X - \mu}{\sigma} \tag{4-10}$$

is a normal random variable with E(Z) = 0 and V(Z) = 1. That is, Z is a standard normal random variable.

#### Example 4-13

Suppose the current measurements in a strip of wire are assumed to follow a normal distribution with a mean of 10 milliamperes and a variance of 4 (milliamperes)<sup>2</sup>. What is the probability that a measurement will exceed 13 milliamperes?

Let X denote the current in milliamperes. The requested probability can be represented as P(X > 13). Let Z = (X - 10)/2. The relationship between the several values of X and the transformed values of Z are shown in Fig. 4-15. We note that X > 13 corresponds to Z > 1.5. Therefore, from Appendix Table II,

$$P(X > 13) = P(Z > 1.5) = 1 - P(Z \le 1.5) = 1 - 0.93319 = 0.06681$$

Rather than using Fig. 4-15, the probability can be found from the inequality X > 13. That is,

$$P(X > 13) = P\left(\frac{(X - 10)}{2} > \frac{(13 - 10)}{2}\right) = P(Z > 1.5) = 0.06681$$

Figure 4-15 Standardizing a normal random variable.

### **To Calculate Probability**

Suppose X is a normal random variable with mean  $\mu$  and variance  $\sigma^2$ . Then,

$$P(X \le x) = P\left(\frac{X - \mu}{\sigma} \le \frac{x - \mu}{\sigma}\right) = P(Z \le z)$$
 (4-11)

where Z is a standard normal random variable, and  $z = \frac{(x - \mu)}{\sigma}$  is the z-value obtained by standardizing X.

The probability is obtained by entering Appendix Table II with  $z = (x - \mu)/\sigma$ .

### Example 4-14

Continuing the previous example, what is the probability that a current measurement is between 9 and 11 milliamperes? From Fig. 4-15, or by proceeding algebraically, we have

#### Solution:

$$P(9 < X < 11) = P((9 - 10)/2 < (X - 10)/2 < (11 - 10)/2)$$
  
=  $P(-0.5 < Z < 0.5) = P(Z < 0.5) - P(Z < -0.5)$   
=  $0.69146 - 0.30854 = 0.38292$ 

### Example 4-14 (continued)

Determine the value for which the probability that a current measurement is below this value is 0.98. The requested value is shown graphically in Fig. 4-16. We need the value of x such that P(X < x) = 0.98. By standardizing, this probability expression can be written as

$$P(X < x) = P((X - 10)/2 < (x - 10)/2)$$
  
=  $P(Z < (x - 10)/2)$   
= 0.98

Appendix Table II is used to find the z-value such that P(Z < z) = 0.98. The nearest probability from Table II results in

$$P(Z < 2.05) = 0.97982$$

Therefore, (x - 10)/2 = 2.05, and the standardizing transformation is used in reverse to solve for x. The result is

$$x = 2(2.05) + 10 = 14.1$$
 milliamperes

### Example 4-14 (continued)

**Figure 4-16** Determining the value of *x* to meet a specified probability.

#### Example 4 – 15 Signal Detection

Assume that in the detection of a digital signal the background noise follows a normal distribution with a mean of 0 volt and standard deviation of 0.45 volt. The system assumes a digital 1 has been transmitted when the voltage exceed 0.9. What is the probability of detecting a digit 1 when none was sent?

#### Solution:

Let the random variable N denote the voltage of noise. The requested probability is

$$P(N > 0.9) = P\left(\frac{N}{0.45} > \frac{0.9}{0.45}\right) = P(Z > 2) = 1 - 0.97725 = 0.02275$$
.

#### Example 4 - 16 Shaft Diameter

The diameter of a shaft in an optical storage drive is normal distributed with mean 0.2508 inch and standard deviation 0.0005 inch. The specifications on the shaft are 0.2500  $\pm$  0.0015 inch. What proportion of shafts conforms to specifications?

Let X denote the shaft diameter in inches. The requested probability is shown in Fig.4 - 18

and

$$P(0.2485 < X < 0.2515) = P\left(\frac{0.2485 - 0.2508}{0.0005} < Z < \frac{0.2515 - 0.2508}{0.0005}\right)$$
$$= P(-4.6 < Z < 1.4) = 0.91924.$$

• Under certain conditions, the normal distribution can be used to approximate the binomial distribution and the Poisson distribution.

Figure 4-19 Normal approximation to the binomial.

#### Example 4-17

In a digital communication channel, assume that the number of bits received in error can be modeled by a binomial random variable, and assume that the probability that a bit is received in error is  $1 \times 10^{-5}$ . If 16 million bits are transmitted, what is the probability that more than 150 errors occur?

Let the random variable X denote the number of errors. Then X is a binomial random variable and

$$P(X > 150) = 1 - P(x \le 150) = 1 - \sum_{x=0}^{150} {16,000,000 \choose x} (10^{-5})^x (1 - 10^{-5})^{16,000,000 - x}$$

Clearly, the probability in Example 4-17 is difficult to compute. Fortunately, the normal distribution can be used to provide an excellent approximation in this example.

#### Normal Approximation to the Binomial Distribution

If X is a binomial random variable, with parameters n and p

$$Z = \frac{X - np}{\sqrt{np(1 - p)}} \tag{4-12}$$

is approximately a standard normal random variable. To approximate a binomial probability with a normal distribution a continuity correction is applied as follows

$$P(X \le x) = P(X \le x + 0.5) \cong P\left(Z \le \frac{x + 0.5 - np}{\sqrt{np(1 - p)}}\right)$$

and

$$P(x \le X) = P(x - 0.5 \le X) \cong P\left(\frac{x - 0.5 - np}{\sqrt{np(1 - p)}} \le Z\right)$$

The approximation is good for np > 5 and n(1 - p) > 5.

#### Example 4-18

The digital communication problem in the previous example is solved as follows:

$$P(X > 150) = P\left(\frac{X - 0.5 - 160}{\sqrt{160(1 - 10^{-5})}} > \frac{151 - 0.5 - 160}{\sqrt{160(1 - 10^{-5})}}\right)$$
$$= P(Z > -0.75) = P(Z < 0.75) = 0.7733$$

Because  $np = (16 \times 10^6)(1 \times 10^{-5}) = 160$  and n(1-p) is much larger, the approximation is expected to work well in this case.

#### Example 4 – 19 Normal Approximation to Binimial

Again consider the transmission of bits in Example 4 – 18. To judge how well the normal approximation works, assume only n = 50 bits are to be transmitted and that the probability of an error is p = 0.1. the exact probability that 2 or less erros occur is

$$P(X \le 2) = {50 \choose 0} 0.9^{50} + {50 \choose 1} 0.9^{49} + {50 \choose 2} 0.9^{48} = 0.112$$

#### Example 4 - 19 Normal Approximation to Binimial

Based on the normal appriximation

$$P(X \le 2) = P\left(\frac{X - 5}{\sqrt{50(0.1)(0.9)}} < \frac{2.5 - 5}{\sqrt{50(0.1)(0.9)}}\right) = P(Z < -1.18) = 0.119$$

As another example,  $P(8 < X) = P(9 \le X)$  and this better approximated as

$$P(9 \le X) \approx P\left(\frac{8.5 - 5}{2.12} \le Z\right) = P(1.65 \le Z) = 0.05$$
  
=  $P(Z > -0.79) = P(Z < 0.79) = 0.785$ 

#### Example 4 – 19 Normal Approximation to Binimial

We can approximate  $P(X=5)=P(5 \le X \le 5)$  as

$$P(5 \le X \le 5) = P\left(\frac{5 - 0.5 - 5}{2.12} \le Z \le \frac{5 + 0.5 - 5}{2.12}\right) = P(-0.24 \le Z \le 0.24) = 0.19$$
.

Figure 4-20 Binomial distribution is not symmetrical if p is near 0 or 1.

hypergometric 
$$\approx$$
 binomial  $\approx$  normal distribution  $\frac{n}{N} < 0.1$  distribution  $\frac{n}{n(1-p) > 5}$  distribution

Figure 4-21 Conditions for approximating hypergeometric and binomial probabilities.

#### Normal Approximation to the Poisson Distribution

If X is a Poisson random variable with  $E(X) = \lambda$  and  $V(X) = \lambda$ ,

$$Z = \frac{X - \lambda}{\sqrt{\lambda}} \tag{4-13}$$

is approximately a standard normal random variable. The approximation is good for

$$\lambda > 5$$

### Example 4-20

Assume that the number of asbestos particles in a squared meter of dust on a surface follows a Poisson distribution with a mean of 1000. If a squared meter of dust is analyzed, what is the probability that less than 950 particles are found?

This probability can be expressed exactly as

$$P(X < 950) = \sum_{x=0}^{949} \frac{e^{-1000}.1000^x}{x!}$$

The computational difficulty is clear. The probability can be approximated as

$$P(X \le x) = P\left(Z \le \frac{950 - 1000}{\sqrt{1000}}\right) = P(Z \le -1.58) = 0.057$$

#### **Definition**

The random variable X that equals the distance between successive events of a Poisson process with mean  $\lambda > 0$  is an exponential random variable with parameter  $\lambda$ . The probability density function of X is

$$f(x) = \lambda e^{-\lambda x}$$
 for  $0 \le x < \infty$  (4-14)

#### **Mean and Variance**

If the random variable X has an exponential distribution with parameter  $\lambda$ ,

$$\mu = E(X) = \frac{1}{\lambda} \text{ and } \sigma^2 = V(X) = \frac{1}{\lambda^2}$$
 (4-15)

It is important to **use consistent units** in the calculation of probabilities, means, and variances involving exponential random variables. The following example illustrates unit conversions.

### Example 4-21

In a large corporate computer network, user log-ons to the system can be modeled as a Poisson process with a mean of 25 log-ons per hour. What is the probability that there are no log-ons in an interval of 6 minutes?

Let X denote the time in hours from the start of the interval until the first log-on. Then, X has an exponential distribution with  $\lambda = 25$  log-ons per hour. We are interested in the probability that X exceeds 6 minutes. Because  $\lambda$  is given in log-ons per hour, we express all time units in hours. That is, 6 minutes = 0.1 hour. The probability requested is shown as the shaded area under the probability density function in Fig. 4-23. Therefore,

$$P(X > 0.1) = \int_{0.1}^{\infty} 25e^{-25x} dx = e^{-25(0.1)} = 0.082$$

Figure 4-23 Probability for the exponential distribution in Example 4-21.

#### Example 4-21 (continued)

Also, the cumulative distribution function can be used to obtain the same result as follows:

$$P(X > 0.1) = 1 - F(0.1) = e^{-25(0.1)}$$

An identical answer is obtained by expressing the mean number of log-ons as 0.417 logons per minute and computing the probability that the time until the next log-on exceeds 6 minutes. Try it.

What is the probability that the time until the next log-on is between 2 and 3 minutes? Upon converting all units to hours,

$$P(0.033 < X < 0.05) = \int_{0.033}^{0.05} 25e^{-25x} dx = -e^{-25x} \Big|_{0.033}^{0.05} = 0.152$$

#### Example 4-21 (continued)

An alternative solution is

$$P(0.033 < X < 0.05) = F(0.05) - F(0.033) = 0.152$$

Determine the interval of time such that the probability that no log-on occurs in the it val is 0.90. The question asks for the length of time x such that P(X > x) = 0.90. Now,

$$P(X > x) = e^{-25x} = 0.90$$

Take the (natural) log of both sides to obtain  $-25x = \ln(0.90) = -0.1054$ . Therefore,

$$x = 0.00421 \text{ hour} = 0.25 \text{ minute}$$

### Example 4-21 (continued)

Furthermore, the mean time until the next log-on is

$$\mu = 1/25 = 0.04 \text{ hour} = 2.4 \text{ minutes}$$

The standard deviation of the time until the next log-on is

$$\sigma = 1/25 \text{ hours} = 2.4 \text{ minutes}$$
